Drip Line vs Soaker Hose - What's the difference ?

Professional Drip Line Retail Soaker Hose

Commonly used black soaker hose does not provide consistent water output along its entire length, especially when multiple hoses are connected end to end. Sections closest to the water supply "leak" more water than those further away.

Drip line is engineered to provide consistent pressure and water output along its entire length

Soaker hose does not hold up well when buried underground where foundation watering lines are most effectively installed. Soaker hoses can start deteriorating within just a few years.

Drip line will last for many decades which is why it is the choice for professional irrigation and agricultural applications requiring reliable sub-surface watering.

Soaker hose does not inhibit root intrusion and actually invites roots from surrounding turf and plants.

Our Rainbird Drip Line with Copper Shield technology inhibits root intrusion to assure many years of effective sub-surface watering.
